BOB MILLER
Acting Governor

To the People of Nevada:

The information in the following pages provides a statistical profile of the agricultural industry in Nevada. The business of agriculture has become increasingly competitive and the need for accurate and timely information on which to base sound business decisions becomes crucial.

Farmers and ranchers in Nevada have always demonstrated the business skill required to survive and prosper through drought, harsh climate and changing market conditions. The agricultural statistics presented within this bulletin provide essential information for making informed decisions. I am certain this publication will prove useful when making decisions that will ultimately determine the success of an agricultural business.

Sincerely,

A handwritten signature in cursive script, appearing to read "Bob Miller".

To Friends of Nevada Agriculture:

I am pleased to present the 1989 edition of Nevada Agricultural Statistics. Agriculture is an extremely important part of our State's economy. Good information on agriculture is very important in making production decisions.

Agriculture is constantly becoming more complex with changing economic and climatic conditions. Agricultural products are subject to a world-wide economy which requires more detailed information. The data in this publication on crops, livestock, farm income, prices and weather is designed to assist those making agriculture decisions.

We are happy to cooperate with the Nevada State Department of Agriculture and the Nevada Agricultural Statistics Service in the presentation of this report. The cooperation of Nevada ranchers and farmers who voluntarily provided the basic data is greatly appreciated.

Sincerely,

Bernard M. Jones

FOREWORD

The 1988-89 bulletin continues a service dating back to 1968 and is one of the most requested and used within and outside the state. The information in this bulletin provides a comprehensive record of crop and livestock production and value, and a host of related statistics about Nevada agriculture that should be of interest to a wide variety of data users. As production, processing and distribution of food products becomes more and more complex, accurate statistics become an increasingly important decision-making tool to all those in the food and agricultural complex.

The information in this bulletin comes from the best source--the farmers, ranchers and agri-businesses in Nevada. We appreciate the high level of cooperation we receive from them in answering our survey questionnaires.

We also want to thank our dedicated field and telephone interviewers and office staff who collect and summarize this information. A special thanks to Marj McClung who had overall responsibility for the bulletin layout.

C. R. "Bud" Lies
State Statistician

WEATHER SUMMARY, 1987-88

GENERAL: Precipitation for the water year October 1, 1987 through September 30, 1988 totaled 8.43 inches--more than 4 percent below normal but less than an inch higher than a year earlier. Fall started dry and warm with typical Indian Summer type weather in October that extended well into November. Pleasant fall weather ended relatively late as the first hard freezes didn't occur until late in November. First significant snowstorms of the season didn't occur until about mid-January. January started cold and ended cold with below normal precipitation. February had one short cold spell, but the month was mostly mild with negligible precipitation. March came in like a lion and went out like a lamb. April was mild but May weather was extremely variable, ending with a cold storm and freezing temperatures. Temperatures during the summer season set new records for consecutive days with highs of 100 degrees or above. First snow of the season fell late in September but didn't last very long. Temperatures during the 1987-88 year averaged 51.2 degrees--about normal. July returned as the hottest month of the summer season with an average of 75.4 degrees.

FALL 1987: October was mostly dry and warm. Temperatures were well above normal including some record highs during the first half of the month. Near midmonth, a few low pressure systems generated showers in southern, northwestern, and northeastern areas. Light snow accumulated above the 8,500 foot level. Scattered, light showers continued throughout the remainder of October. Light frosts occurred during October, but no vegetative-killing low temperatures were recorded. November started like October ended, with scattered light showers in most areas. Widespread showers were heavier midmonth with some flooding reported. Pacific storms continued to produce precipitation after midmonth, but temperatures dropped sharply in all areas. Parts of the south had the first hard freeze of the season. November ended mostly dry and cold.

WINTER 1987-1988: December started with a warming trend and light, scattered showers but changed quickly when cold arctic air dropped temperatures well below normal. Blustery north winds accompanying the storm produced isolated snow showers. Due to a southerly dip of the jetstream, cold air masses remained over Nevada the remainder of December. January started with cold air masses and snow flurries were common in all areas. This weather pattern was changed by moist, tropical air that brought mostly cloudy conditions. Rain and/or snow was common midmonth. The remainder of the month was mostly dry with temperatures ranging from slightly below normal to well below normal. February started with temperatures near normal. Precipitation ranged from light in the north to none in the south. Colder, dry air moved into Nevada which lingered for about a week. Due to the clear weather, night temperatures were extremely low. Unseasonably mild weather dominated near midmonth. Precipitation was negligible but average temperatures rose to well above normal. High pressure systems produced dry conditions and above normal temperatures the last half of February.

SPRING 1988: March came in like a lion with gusty winds, scattered showers, and up to one foot of snow at higher elevations. Mostly clear skies predominated at midmonth, and temperatures were a few degrees below normal despite the sunny weather. Jet streams forced storm fronts to slide north again for the remainder of the month, producing mostly sunny skies and near normal temperatures. So, March went out like a lamb. April began like March ended with above normal temperatures but only trace amounts of precipitation. Northerly air flows dropped temperatures sharply the second week. Gusty winds were recorded at 60-75 mph with considerable blowing of

sand and topsoil in numerous areas. Temperatures fluctuated well above normal again, but by midmonth had cooled considerably with substantial rain and snow over most western and southern areas. Cold weather the third week resulted in snow accumulations at higher elevations. April ended with a series of storms producing only light precipitation, mainly in the form of snow, gusty winds, and below normal temperatures. May weather was extremely variable, ranging from cold, wet and windy to very warm with sunny skies. Gusty winds accompanying frequent storms were common throughout the month. Precipitation was well below normal, but temperatures generally averaged near to above normal. A cold front moved in the last few days of May and dropped nighttime temperatures to freezing and below and brought snow to higher elevations. As a result, frost damage was reported in many areas.

SUMMER 1988: June started like winter with strong cold fronts bringing gusty winds, below normal temperatures, and snow showers to all areas except the extreme south. Cool, dry weather persisted through midmonth when a warming trend produced widely scattered storms but no significant precipitation. An extreme heat wave with record-breaking temperatures near the end of June stimulated widely scattered thunderstorms that created range and forest fires but no meaningful precipitation. July began with above normal temperatures and ended with a record number of consecutive days of readings with 100 degrees or above. A weak cold front early in the month lowered daytime temperatures but produced no significant precipitation. A few isolated thunderstorms near midmonth produced trace amounts of rain but temperatures continued unseasonably warm and windy. Temperatures the remainder of July were extremely high with 100 degrees or higher readings common in all areas. Afternoon thunderstorms during this extreme heat period produced the condition called a Virga (rainfall evaporating before it reaches the ground). Record high temperatures experienced in July extended into August. Readings of 100 degrees or higher were common in all areas early in the month. Only light, spotty rainfall amounts were generated from widely scattered thunderstorms. Some range and forest fires were started by lightning strikes but acreages burned were relatively small. Remainder of August was about the same as in the beginning--mostly dry with searing daytime temperatures. September started like August ended--with temperatures well above normal including some record highs. The only precipitation at the beginning of September was in the form of light, scattered afternoon thunderstorms in the southern areas. First cool air of the summer season dropped temperatures midmonth but only trace amounts of precipitation were recorded. Cool weather was short lived as temperatures returned to normal by the end of the month. No precipitation was reported the last half of September. First snow of the season fell in the western Sierras but didn't last long.

ANNUAL CROP SUMMARY

Nevada farmers and ranchers produced more **alfalfa hay**, **garlic** and **onions** in 1988 but production of all other crops showed declines from the previous year. Harvested acreage for **alfalfa hay**, **alfalfa seed**, **garlic** and **onions** was up slightly, but acreage for most other crops remained the same or decreased considerably from the previous year. All **wheat** production dropped 20 percent and **barley** output was 16 percent below the previous year. This is the smallest **wheat crop** since 1983 and the smallest **barley crop** since 1981. The **potato crop** was 9 percent smaller and **alfalfa seed** production was up 4 percent despite a slight increase in acreage. This is the smallest **potato crop** since 1974 when potato estimates were reinstated. **Onion** output increased 37 percent, the result of increased acreage as average yield remained the same. **Garlic** production increased 30 percent as acreage almost doubled but the average yield dropped 2 tons per acre. The total value of selected crops produced in the state was \$171.4 million in 1988, up 26 percent from the 1987 total of 135.7 million. The increase in total value was the result of higher prices as yields and harvested acres were down for most crops.

LIVESTOCK SLAUGHTER

Total liveweight of animals slaughtered in Nevada's commercial slaughter plants increased 19 percent during 1988. Cattle accounted for 2.3 million pounds or 62 percent of the total--15 percent less than a year earlier. These estimates include slaughter in Nevada's 6 federally inspected plants, but exclude animals slaughtered on farms and ranches.

1988 AERIAL AND GROUND PEST CONTROL SUMMARY

This summary was compiled from information contained in mandatory monthly reports submitted to this Department by the 1988 custom aerial pest control licensees. Its accuracy is based on these monthly reports and the data therein does not constitute approval or recommendations by this Department or the National Agricultural Statistics Service.
